The need for rapid and inexpensive diagnosis of disease states, infectious diseases in particular, is readily apparent in that these diseases generally result in acute health problems requiring immediate medical attention. Currently, medical personnel often must wait for the results of conventional tests, such as culture and antigen testing of body fluids, before taking a patient's history and conducting preliminary tests to determine whether a patient needs immediate medical attention. The delay in obtaining results, and the possible need for extensive blood tests, can result in patient fatalities. Additionally, delays in diagnosis, and in some instances, the incorrect administration of antibiotics, have resulted in patient deaths. Accordingly, there exists a need for a fast, easy, accurate, and inexpensive method of detecting infectious disease in the human body. This invention addresses this need, among others, by providing a method of detecting infection or disease using novel nucleic acid hybridization assays. The invention provides a method of detecting an infectious or disease-causing microorganism in a sample suspected of containing at least one microorganism which includes the steps of contacting the sample with a probe having a nucleic acid portion complementary to at least a portion of the nucleic acid of at least one microorganism which can cause the infectious or disease-causing microorganism; contacting the nucleic acid portion of the probe with a second nucleic acid, the second nucleic acid having an aptamer portion complementary to the second nucleic acid and having an aptamer portion with a nucleic acid portion that includes an antisense region that is complementary to at least a portion of the nucleic acid portion of the first nucle

Create interactive charts and graphs for target computers by plotting MFET or RODT data, and custom sets of values. It must be a control panel with buttons! If you have some kind of line of business applications, you want to put a control panel button next to your menus and toolbars. The following step-by-step guide will show you how to create a Windows XP control panel. This tutorial assumes that you have already created a Standard or Custom control panel in Visual Studio 2008 Express Edition. It could

be that you've already done that, but if not, I strongly recommend that you download a trial version of this fantastic application, since it makes it really easy to create your own control panels. By creating a Windows XP control panel application, you can enhance your existing application with two options: You can create a user interface for your applications that does not use any menus or toolbars, and will look identical in other Windows XP control panel applications. You can create an additional button on a menu or toolbar in your existing application, that opens an application with a default control panel. In either case, you can access this new control panel button from a variety of locations, and of course, in a variety of dialog boxes! You can even access this menu button in the context of a stand-alone executable program or a Windows service. I will show you how to create a Windows XP control panel that is completely independent of any toolbars or menus. I will also teach you how to create this control panel button in Visual Studio 2008 Express Edition. Please note that this is a very simple tutorial, that only shows the basic steps necessary to build a control panel application. This tutorial does not cover the creation of a full-blown application in Visual Studio 2008 Express Edition. Now, let's begin. First of all, you need to create a new Windows XP Windows Control Panel application. Since you're doing this in Visual Studio, the default application template is very suitable for this purpose, and looks very similar to Visual Studio's own standard user interface. The first step is to create a blank Windows XP Windows Control Panel application. While you're creating this application, you can set a name, description, and location for the control panel. Note: Do not create multiple.CPR files as it won't work as intended. The tutorial application name should be specified in the Application Name property of the application, in the
